

3. Testing & Validation Evidence

HealthConnect Experience Lab — Dashboard Review and Refinement

After building the dashboard, I reviewed it to make sure the information was easy to find and that the different visuals were telling a consistent story. The goal of the testing was not only to check whether charts were present, but also to see whether a user could understand the main attendance problem without having to search through the page.

Testing performed

Area checked	What I looked at	Outcome
KPI visibility	I checked that the main figures were clearly visible at the top of the dashboard.	The four main KPI cards are easy to see.
Chart readability	I reviewed chart titles, labels, percentages and legends.	The charts are labelled clearly enough to understand what is being compared.
Filters	I checked whether the main filters were visible and understandable.	Appointment day, appointment type and reminder-sent filters are available.
Consistency	I compared the different no-show views to make sure they support the same overall story.	The visuals provide different views of the attendance issue.
Operational usefulness	I considered whether the dashboard helps a user identify areas worth investigating.	The segment charts make follow-up questions possible.

What was refined

One of the main improvements was keeping the high-level KPIs together at the top. This means a user can see the overall number of appointments, no-show rate, number of no-shows and displayed revenue impact before looking at the detailed charts.

I also kept the detailed analysis below the KPI cards and used several breakdowns rather than relying on one chart. This gives the user a clearer path from the overall result to possible areas for investigation.

The testing also helped confirm an important interpretation point: the dashboard shows relationships and differences in the data, but those differences should not automatically be treated as proof that one factor caused another.
